CombiTrailers are a modular designed transport-system with a wide range of possible combinations that offer customized solutions for any transport application. The 2- to 6-axle modules can be combined with various loading equipment such as crawler decks, drop decks and vessel bridges. CombiTrailers can be moved with a draw-bar or alternatively with a gooseneck as trailer.

SPMTs - Self propelled modular transporters - establish a new horizon in heavy transports. The modular combined units allow us to offer you heavy haulage with a nearly unlimited capacity. The 4- to 6-axle modules can easily be coupled in a row or lateral with one another. Together with the steering capabilities like sideway travels or rotation in own length this leads to a boundless flexibility of possible transports relating to transport length, width, weight and manoeuvrability. This page shows you a little overview about the possibilities and the use of SPMTs.

Dimensions in meters, weights and capacities in metric tonnes. For reference only.
